

**Amendments to the Claims:**

The following claims will replace all prior versions of the claims in this application (in the unlikely event that no claims follow herein, the previously pending claims will remain):

1. (Currently Amended) A self-sustaining center-anchor microelectromechanical switch comprising:
  - transmission lines formed on a substrate at a predetermined gap and having an input portion and an output portion;
  - ground lines formed at both sides of the transmission lines;
  - a dielectric-moving plate formed over the substrate and including a switching unit that electrically connects the transmission line during short-circuit operation;
  - anchors having a self-sustaining center-anchor formed on the center of the transmission lines to support the dielectric-moving plate to the substrate; and
  - upper electrodes located in an upper portion of the dielectric-moving plate different than where the switching unit is located and serving as a driving electrode to the ground line, wherein the switching unit is operated by a bending of the dielectric-moving plate generated by a voltage difference applied to the upper electrode and the ground line, and switches the transmission lines.
2. (Currently Amended) The self-sustaining center-anchor microelectromechanical switch of claim 1, wherein ~~the transmission lines comprise an open portion of the transmission line used for the self-sustaining center-anchor between the input portion and the output portion~~ is located in the gap between the transmission line having the input portion and the transmission line having the output portion.
3. (Original) The self-sustaining center-anchor microelectromechanical switch of claim 1, wherein the anchors further comprise edge-anchors and electrode anchors.
4. (Original) The self-sustaining center-anchor microelectromechanical switch of claim 3, wherein the edge-anchors and the dielectric-moving plate have a connecting portion for connecting with each other, the portion being inserted by corrugated patterns.

5. (Original) The self-sustaining center-anchor microelectromechanical switch of claim 1, wherein the self-sustaining center-anchor and the dielectric-moving plate have a connecting portion for connecting with each other, the portion being inserted by rectangular patterns.

6. (Currently Amended) The self-sustaining center-anchor microelectromechanical switch of claim 1, wherein the ~~electrode~~ anchors and the dielectric-moving plate have a connecting portion for connecting with each other, the portion being inserted by checked patterns.

7-16. (Cancelled)
